JAVASCRIPT INTERVIEW QUESTIONS

// Question No.30 "How does the `map` method work in JavaScript, and can you provide an example of when you might use it to manipulate an array of objects?"

Map Method:

```javascript
const students = [
    { name: 'Alice', score: 85 },
    { name: 'Bob', score: 92 },
    { name: 'Charlie', score: 78 };

const adjustedScores = students.map((student) => {
    return {
    name: student.name,
    adjustedScore: student.score + 5
    };
  });
console.log(adjustedScores);
```

```
// Output:
[
  { name: 'Alice', adjustedScore: 90 },
  { name: 'Bob', adjustedScore: 97 },
  { name: 'Charlie', adjustedScore: 83 }
]
```
